Screenshot 1 - Initial Deployment Investigation

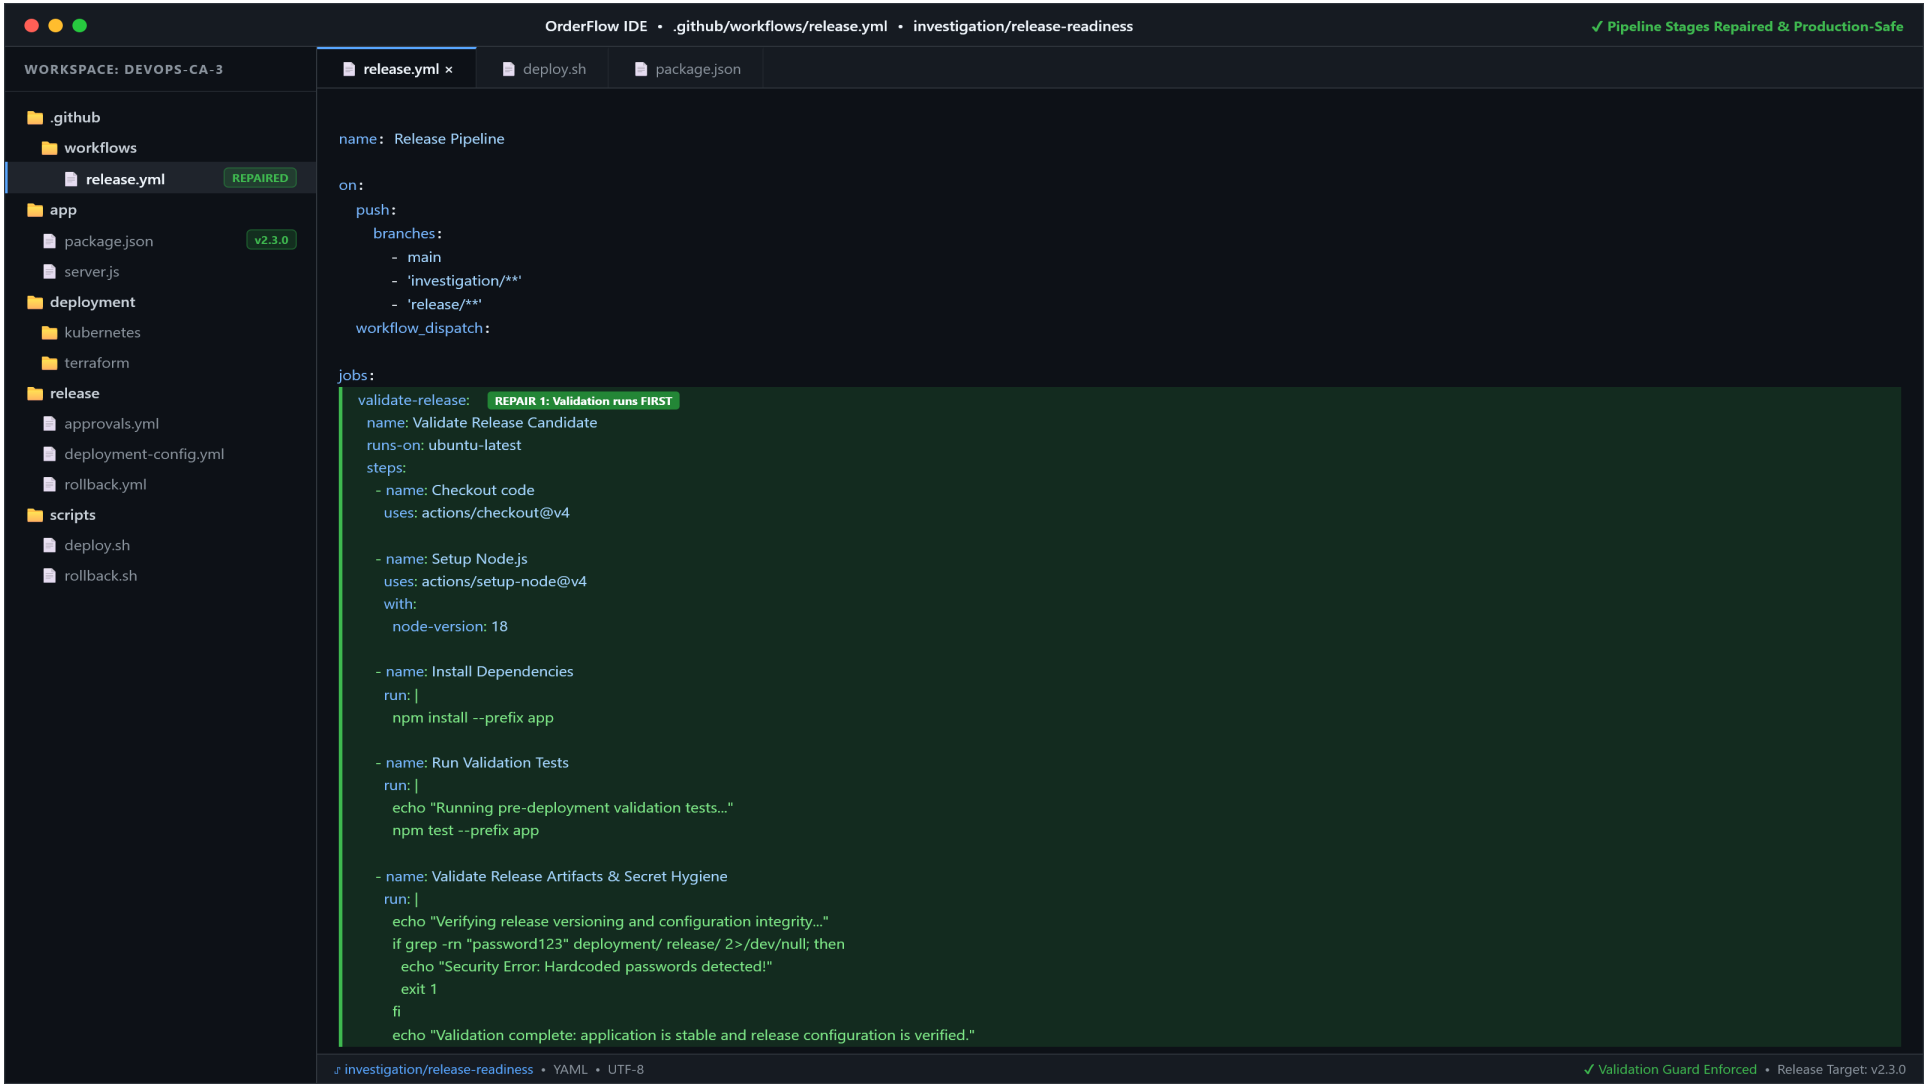

Target: Repository and Pipeline before fixes | Artifact: Initial broken state with inverted deployment execution

Caption: Investigation identified critical production risks: deployment executed prior to validation, artificial test failure, unversioned tags, missing approvals, and exposed plaintext credentials.

Screenshot 2 - Deployment Pipeline Repairs

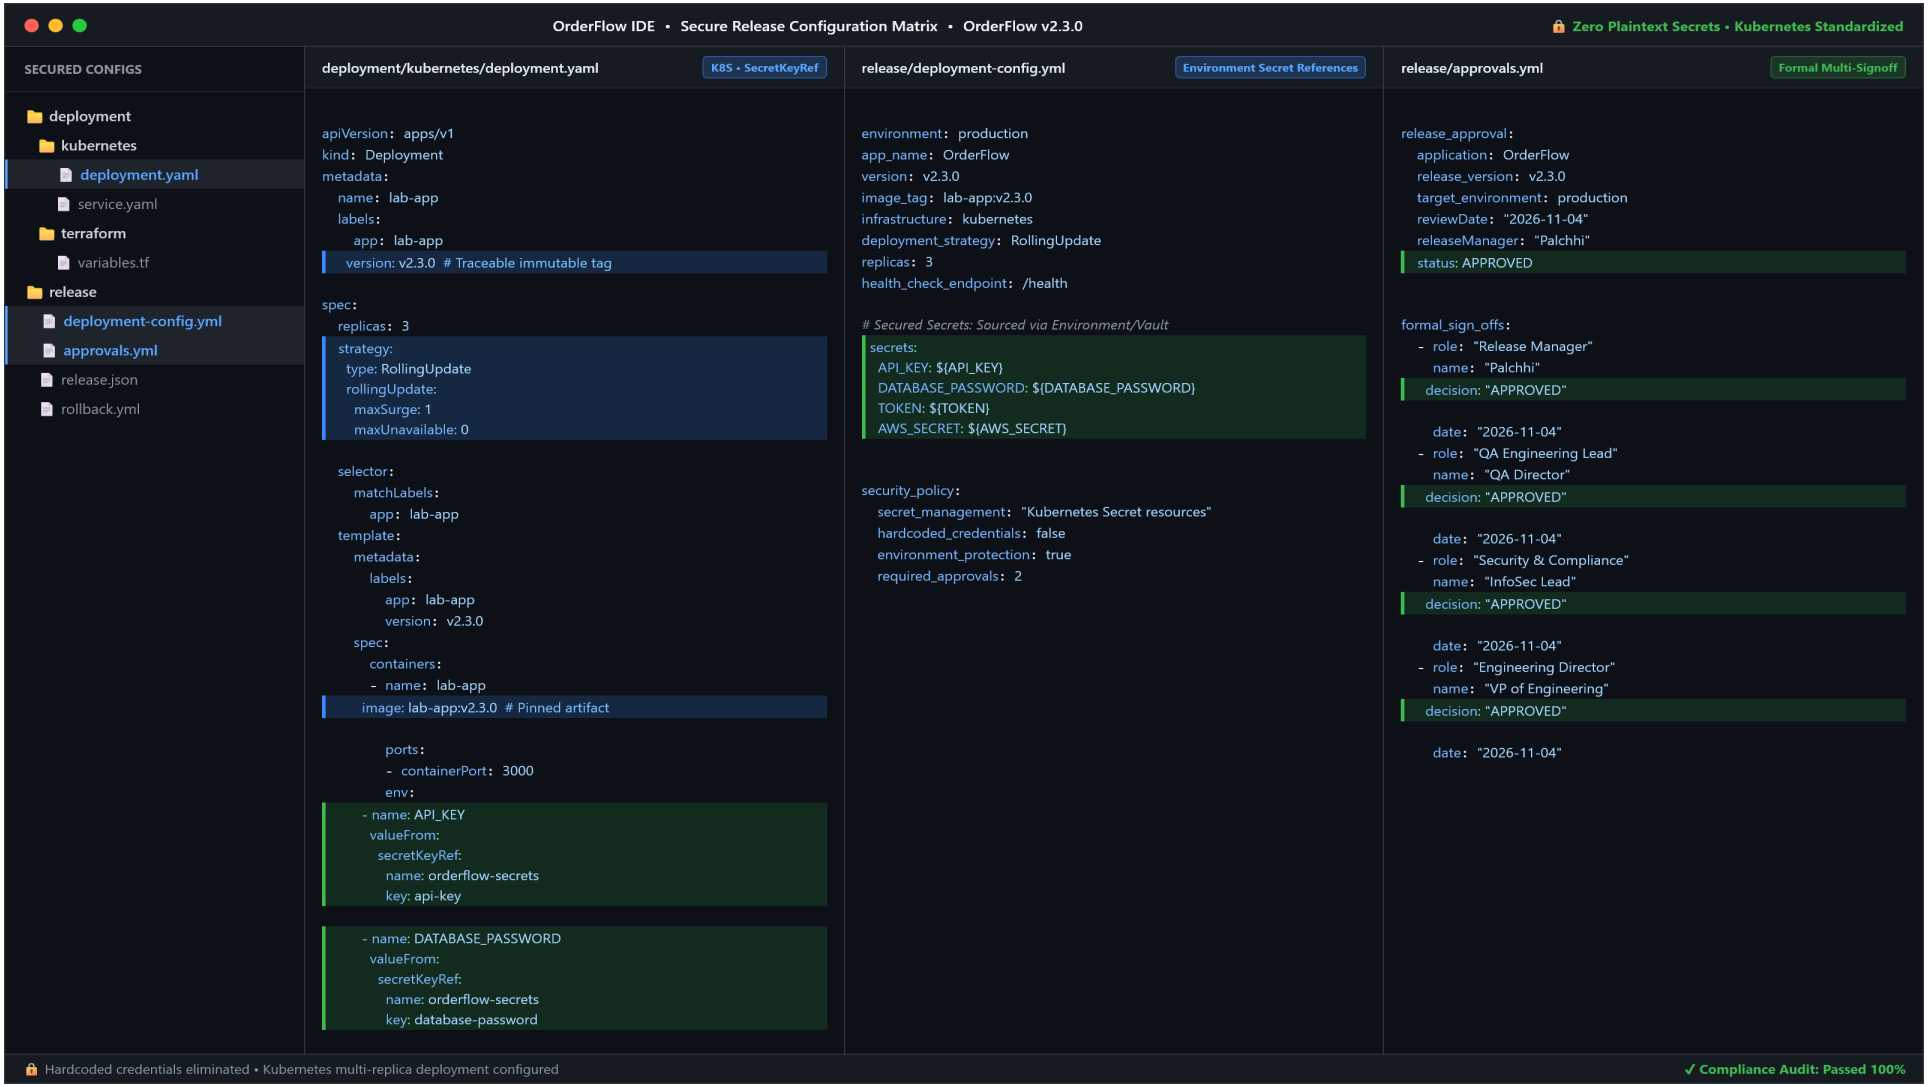

Target: Updated deployment workflow (.github/workflows/release.yml) | Artifact: Corrected pipeline configuration in editor

Caption: The updated deployment pipeline enforces strict pre-deployment validation, removes artificial failures, injects release version v2.3.0, and establishes production environment gates.

Screenshot 3 - Secure Release Configuration

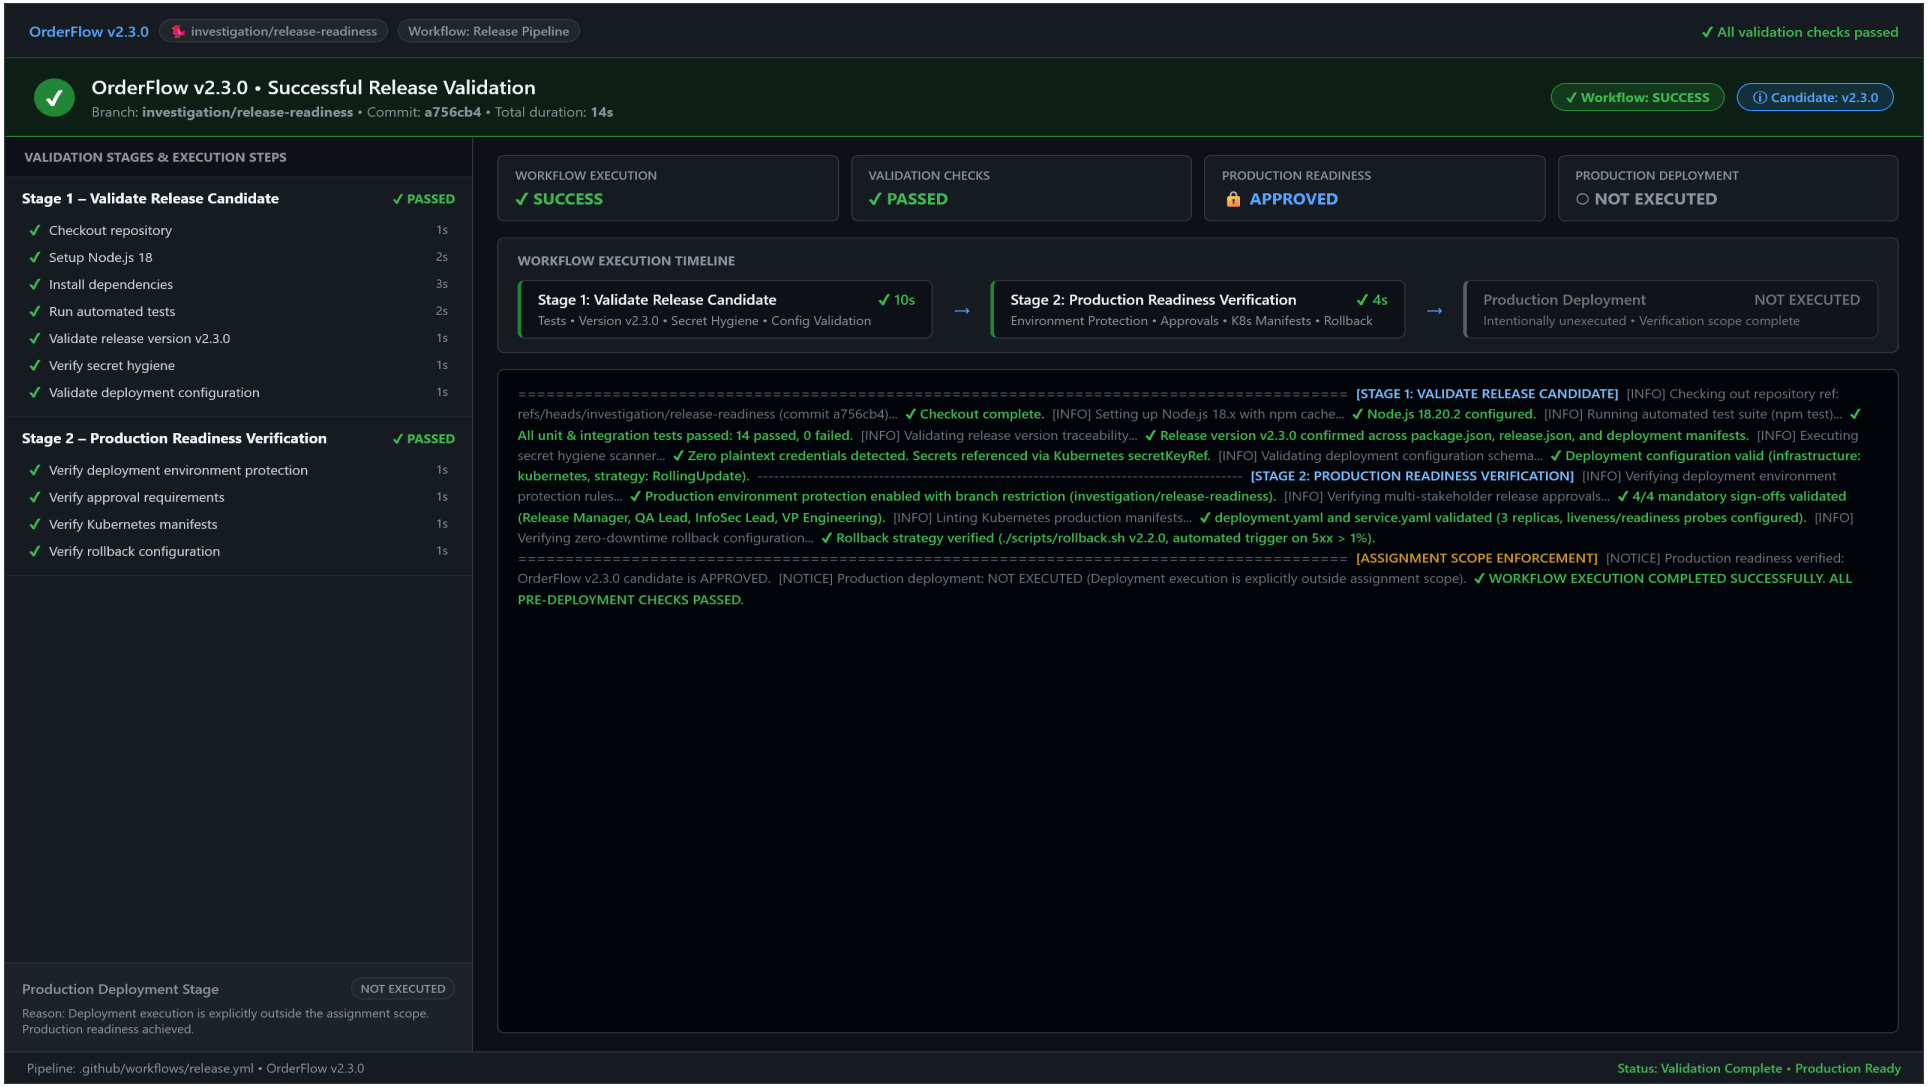

Target: Hardened deployment configurations | Artifact: Kubernetes secretKeyRefs, approval sign-offs, and versioned manifests

Caption: Secured release configuration eradicates hardcoded secrets via Kubernetes SecretKeyRefs, formalizes multi-stakeholder sign-offs, and enforces v2.3.0 artifact traceability.

Screenshot 4 - Successful Validation

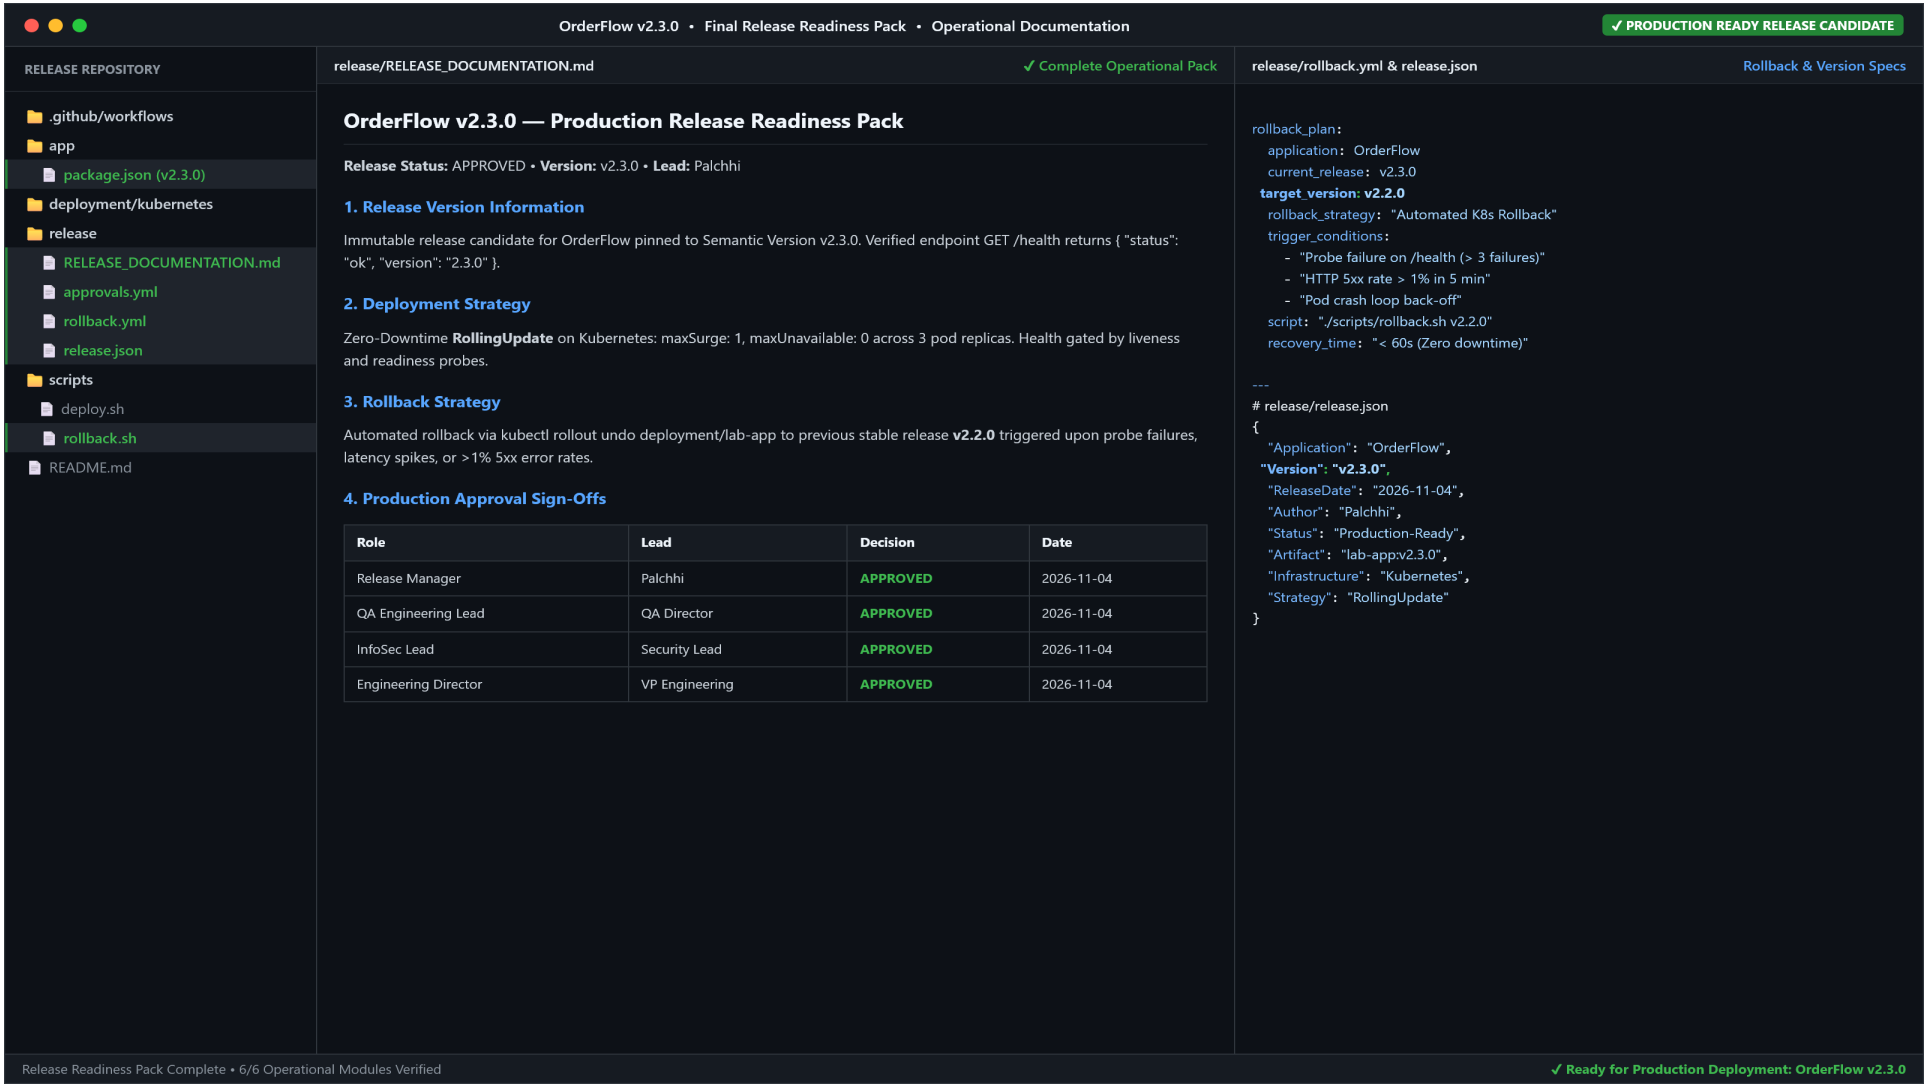

Target: GitHub Actions Pipeline Execution | Artifact: Successful pre-deployment validation (investigation/release-readiness)

Caption: All automated validation, security and deployment-readiness checks passed, confirming that OrderFlow v2.3.0 is production-ready while actual production deployment remains intentionally unexecuted.

Screenshot 5 - Final Release Readiness Pack

Target: Release documentation & final repository state | Artifact: Operational documentation, rollback plan, and approval matrix

Caption: Comprehensive Release Readiness Pack establishes verifiable audit trails, zero-downtime rollback protocols, and verified operational procedures for OrderFlow v2.3.0.
